

Archilles Jacob Azameti

Tailored to official Upwork feedback. Every section rewritten for the business owner buyer, not the technical audience. Changes marked with tags.

OFFICIAL UPWORK FEEDBACK — APPLIED

Headline: Simplify — remove "agentic/multi-agent" jargon, lead with buyer outcome.

Overview: First lines = what the client gets, not what you've built. Products as proof, not opener.

Portfolio: Case study format — problem → build → tech → measurable result.

Proposals: Target AI-aware clients, connect to their workflow, not your stack.

AI Automation Engineer | RAG, AI Agents & FastAPI Backends

OVERVIEW / BIO

FULL REWRITE

copy

I build AI agents, RAG systems, and backend automation that reduce manual work and connect cleanly to your existing tools.

If your team is spending hours on tasks that should take minutes — processing documents, managing leads, generating reports, handling repetitive workflows — I build the systems that eliminate that. You get working automation, not a proof of concept.

Two examples of what that looks like in production:

Sono Health — a clinical AI platform I founded that reduces medical report writing, research, and diagnosis from hours to minutes. Built with a Voice-to-Narrative pipeline, real-time document search grounded in medical literature, and a FHIR-compliant backend built for healthcare data sensitivity.

UmukoziHR — an AI recruiting platform where I served as Founding Engineer. Autonomous

agents replaced weeks of manual candidate research and shortlisting, compressing the process to minutes. 100,000+ lines of production code shipped across the platform.

What I build for clients:

- AI agents that handle multi-step tasks without supervision
- RAG systems — upload your documents, ask questions, get accurate answers
- Backend APIs (FastAPI + PostgreSQL) — production-ready, secured, documented
- Workflow automation — connecting your tools so data moves without manual input
- Voice AI pipelines — speak, get structured output on the other end
- Healthcare AI — FHIR-compliant, PHI-aware, EHR-ready systems

Stack: Python · FastAPI · PostgreSQL · OpenAI · Claude · Gemini · LangChain · AWS · Docker · Redis · n8n · Cursor · Claude Code

I've also consulted for European clients for 2.5 years — translating complex AI architecture into plain business outcomes for founders and executives who don't speak code.

BSc Computer Science, University of the People · Certified: Advanced RAG Agents · Network & Application Security

If your team is drowning in manual workflows, I'll replace them with systems that run without supervision. I don't disappear after delivery — I hand over documented, maintainable systems your team can own.

Let's talk.

PORTFOLIO CASE STUDIES

NEW FORMAT

Sono Health — Clinical AI Documentation Platform

copy

PROBLEM	Healthcare professionals spending hours per patient writing clinical reports, researching diagnoses, and manually documenting findings — time taken away from patient care.
---------	---

WHAT I BUILT	An AI-first clinical documentation platform with a Voice-to-Narrative pipeline: clinicians speak their findings, the system transcribes, extracts structured measurements, searches peer-reviewed medical literature in real time, and generates a complete formatted report automatically.
TECH USED	FastAPI · Google Gemini · FHIR Level 1 · HL7 · PubMed API · Voice AI (Whisper) · LaTeX PDF generation · PostgreSQL · AWS
RESULT	Clinical documentation reduced from hours to minutes per patient. Live in production.

UmukoziHR — Autonomous Recruiting Agent System		copy
PROBLEM	Recruiting teams spending weeks manually researching candidates, cross-referencing profiles, and building shortlists for each open role — a process that didn't scale.	
WHAT I BUILT	A multi-agent talent acquisition system: a SupervisorAgent delegates to a ResearchAgent (live web search), AggregationAgent (consolidates results), and AnalysisAgent (scores and ranks candidates by fit). The system runs without human input from search to shortlist.	
TECH USED	FastAPI · Python · PostgreSQL · Redis · Multi-agent orchestration · AWS · Docker · Circuit breakers · LLM tool-calling	
RESULT	Candidate shortlisting reduced from weeks to minutes. 100K+ lines of production code shipped. Live platform.	

Client Onboarding Automation — Healthcare Operations		copy
PROBLEM	A healthcare services business running a 12-step manual client onboarding process across Gmail, a clinical management platform, digital forms, and a project management CRM — costing the team hours per new client.	
WHAT I BUILT	An AI agent pipeline using n8n + Claude that monitors Gmail for inquiries, sends templated onboarding emails at the right trigger points, automates data entry into the clinical platform via browser automation, updates the CRM pipeline at each stage, and notifies the scheduling team when a client is ready.	

TECH USED n8n · Claude via AWS Bedrock · Playwright browser automation · Gmail API · Monday.com API · Jotform · HIPAA-aware logging

RESULT **12-step manual process replaced by a fully automated pipeline. Staff time per onboarding reduced from hours to near-zero.**

Spanish RAG Chatbot MVP — Document Q&A System

copy

PROBLEM A business needed customers to get accurate answers from internal documents in Spanish — without a support team manually answering every query.

WHAT I BUILT A full RAG system: admin panel for uploading PDF, DOCX, CSV, TXT, and XLSX files, a parsing and chunking pipeline storing content in SQLite, and a Spanish-language chat interface where users ask questions and the AI responds using only the uploaded file content — clearly stating when information isn't available.

TECH USED FastAPI · React · SQLite · OpenAI API · RAG pipeline · Spanish NLP · Admin auth panel

RESULT **Delivered in 48 hours. Accurate document-grounded responses in Spanish with zero hallucination on out-of-scope questions.**

AI Web Scraping & Matching Agent — UmukoziHR Pipeline

copy

PROBLEM Recruiters manually searching multiple platforms to find and evaluate candidates — a repetitive, time-consuming process with inconsistent results.

WHAT I BUILT An autonomous web scraping and matching agent that searches multiple sources on a query, extracts structured profile data, scores candidates against role requirements using an LLM judge, and delivers a ranked shortlist — without human input at any stage.

TECH USED Python · FastAPI · Playwright · LLM-as-judge scoring · PostgreSQL vector matching · Redis caching · AWS

RESULT **Manual research time eliminated. Consistent, scored shortlists delivered in minutes per search.**

UPDATED PROPOSAL STRATEGY — PER UPWORK FEEDBACK

TARGET: AI-AWARE CLIENTS ONLY

Look for job posts that use words like "automation", "AI agent", "workflow", "n8n", "ChatGPT integration", "RAG", "LLM". These clients already understand the value — you don't have to educate them. Skip generic "Python developer needed" posts unless the budget is strong and the problem is clear.

CONNECT TO THEIR WORKFLOW, NOT YOUR STACK

Instead of: "I have experience with LangChain, FastAPI, and multi-agent systems."

Write: "Your team is manually copying form data into your CRM every time a lead comes in. I'll build an agent that does that automatically the moment the form is submitted — no human touch required."

Same skills. The second version is what the client actually buys.

PROOF ORDER IN EVERY PROPOSAL

1. Their specific problem named in line 1
2. How you solve it (one sentence)
3. One proof point (Sono Health or UmukoziHR metric)
4. What you'd do for them specifically
5. CTA — one specific question or Zoom ask

Never list your stack before naming their problem.
